

ABSTRACT OF THE DISCLOSURE

A grill device includes two independently controllable cooking sets confining two isolated cooking spaces such that two different meat pieces can be grilled therein under different cooking temperatures at the same time. Each of the cooking sets has a cooking plate provided with first and second grill ribs alternately disposed thereon. The first grill rib has a horizontal flat portion and a curved portion extending curvedly and downwardly from the flat portion. The second grill rib has a horizontal flat portion, and a curved portion extending curvedly and upwardly from the flat portion. The curved portion of the second grill rib has an elevation higher than those of the flat portions of the first and second ribs to prevent sliding out a meat piece from the cooking plate when the meat piece is disposed on the flat portions of the first and second grill ribs.
